Work Experience

Software Engineer

Ioannina, Greece - Remote

BESTSECRET GMBH

Dec. 2023 - present

- Designed and implemented a scalable event-driven AI recommendation platform on AKS, leveraging Spring Boot microservices, Kafka event streams, ONNX Runtime/CLIP image embeddings, and PostgreSQL pgvector similarity search to asynchronously process incoming product images and generate real-time visually matched fashion set-product recommendations.
- Redesigned the Low Stock Notification (LSN) pipeline to process and deliver ~2M notifications per day, incorporating recently added wishlist products into targeting logic while introducing strict per-customer and global caps and dedicated muting tables, reducing end-to-end processing time from hours to minutes and consistently outperforming the previous system across all attribution windows with sustained uplift in attributed visits and session-value orders.
- Built the Back In Stock (BIS) notification service end-to-end in Kotlin and Spring Boot, processing and dispatching ~500K back-in-stock notifications per day: Kafka consumer for stock-state transition detection via idempotent upserts, tier-based scheduler (Diamond-first, cascading to Basic) dispatching through Salesforce Marketing Cloud, and retry-with-muting for delivery resilience.
- Rolled out BIS by running both the legacy and new schedulers in parallel, with the new path executing in a non-dispatching mode and writing only to its own subscription store, backed by dual-writes for subscription mutations and a backfill tool for pre-existing subscriptions; the service auto-evicts stale subscriptions and tolerates the eventual consistency between the dual stores via idempotent upserts and Kafka-backed retry.
- Exposed the BIS subscription API via REST and GraphQL (NotifyMe), enabling web and mobile customers to subscribe to out-of-stock variants and receive timely alerts.
- Ported the Product Detail Page from a monolith to an Astro.js frontend with TypeScript, GraphQL, and Vue.js; delivered full E2E and unit test coverage in collaboration with cross-functional teams.
- Migrated Product Detail Page backend to a microservice using Kotlin, Spring Boot, Kafka, and PostgreSQL, improving scalability and maintainability.
- Designed a GraphQL API for mobile apps, reducing over-fetching and improving data exchange efficiency.
- Built a high-performance Kafka consumer to process and persist records in cloud storage, optimizing data consistency and throughput.
- Achieved high test coverage with JUnit and Testcontainers through robust unit and integration test suites.
- Set up Datadog monitoring and alerting for observability and proactive system reliability.
- Maintained the monolithic application by resolving bugs and delivering incremental enhancements.

Software Engineer

Ioannina, Greece - Hybrid

TEAMVIEWER GERMANY GMBH

Jan. 2023 - Dec. 2023

- Led the extension of TeamViewer's Web API by integrating new backend functionalities into existing C++ microservices, enabling scripting capabilities previously limited to the Management Console UI.
- Enhanced and maintained core C++ backend services interfacing with C# via a custom binary serialization protocol, ensuring reliable cross-language communication.
- Handled technical support tickets related to backend system behavior, quickly diagnosing issues in C++ service logic and protocol handling to deliver timely and effective resolutions.
- Implemented Chat Access Control features on macOS by modifying the underlying C++ connection and session handling modules, applying user-defined visibility rules during remote sessions.
- Developed migration features for the transition to TeamViewer Remote, modifying C++ service logic to support seamless client switching, including session persistence and UI fallback via auto-restart logic.

Junior Software Engineer

Ioannina, Greece - Hybrid

TEAMVIEWER GERMANY GMBH

May. 2022 - Jan. 2023

- Refactored and integrated C++ IoT microservices into the core backend, improving maintainability, logging, and deployment scalability.
- Built a resilient Java migration tool moving user data from MongoDB to Cassandra with protocol compatibility: chunked reads, retry/backoff, structured logging of failed rows for replay, and idempotent writes ensuring data integrity and zero downtime.
- Exposed C++ IoT APIs through TeamViewer's Web API via a C# wrapper over a custom binary serialization protocol.
- Maintained and optimized the IoT client/frontend stack: fixed C++/C# communication issues, improved binary parsing, and reduced redundant React.js requests while delivering new UI features.

Software Development Intern

Ioannina, Greece - Hybrid

TEAMVIEWER GERMANY GMBH

Oct. 2021 - Apr. 2022

- Developed features for TeamViewer's WebAssembly-based client using C++, React.js, and TypeScript, focusing on optimizing the remote session logic written in C++ for browser execution.
- Implemented backend-facing features using C++ services exposed to the .NET Management Console, improving the robustness and modularity of cross-platform communication layers.
- Maintained End-to-End test automation in C# for C++ service workflows using Ranorex API, contributing to test coverage and validation of key C++ logic paths.
